Classification of fungal diseases can be confusing to the neophyte clinical mycologist. Read the comic strip to find out more.

Some fungal infections are classified by clinical manifestations, like dermatophyoses and eumycetoma.

Others, by morphology in tissue, including hyalohyphomycosis and phaeohyphomycosis.

Or, by both clinical manifestations and morphology! Meet chromoblastomycosis.

And finally, by epidemiology: the endemic mycoses!

Makes sense!

So, a different feature?

Chromowhatnow?

Let me get a pen.
